

# The role of hydrogen storage in the Net Zero Emissions by 2050 Scenario

Amalia Pizarro – Hydrogen and Alternative Fuels Unit

26 May 2023

# Hydrogen infrastructure needs

Global natural gas and hydrogen supplies in the NZE Scenario, 2020-2050

**Hydrogen supply in the NZE Scenario surpasses that of natural gas in 2045 and by 2050 is equivalent to 40% of the current natural gas supply, 75% of it from merchant producers**

# Hydrogen infrastructure – an opportunity for investment

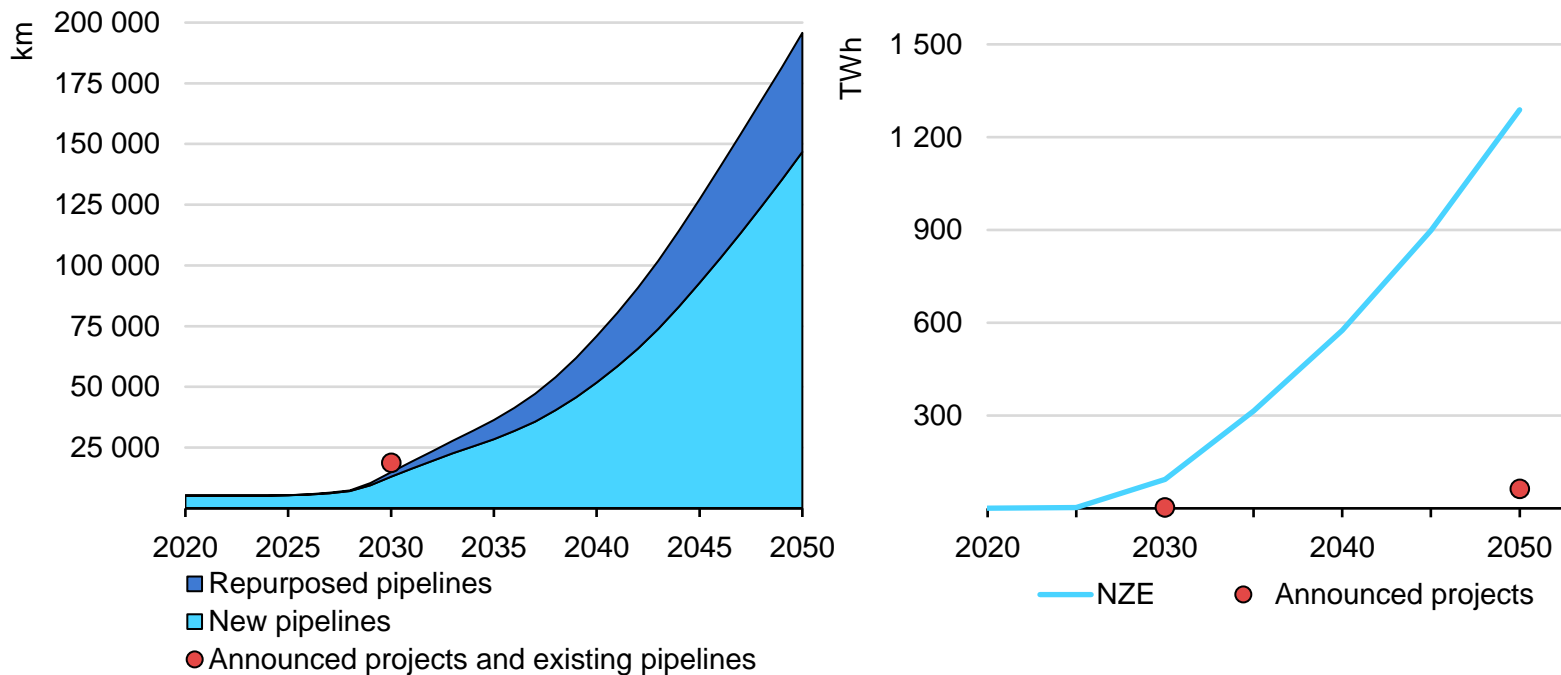

Average annual global investment in hydrogen and natural gas infrastructure in the NZE Scenario, 2016-2050

**The NZE Scenario requires major investments in hydrogen infrastructure, mostly for pipelines and storage**

# Historical growth in natural gas storage by region

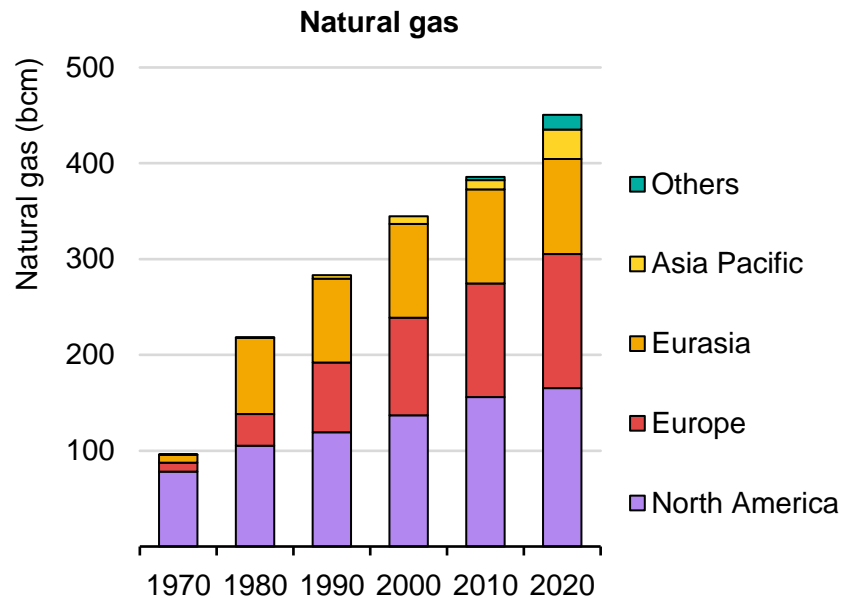

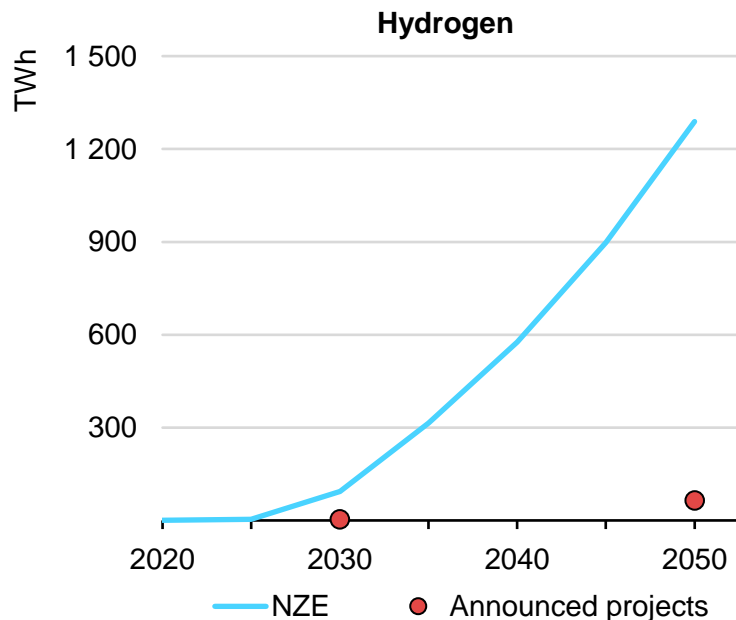

Global hydrogen transmission pipeline length and underground storage capacity in the NZE Scenario, 2020-2050

**Hydrogen transmission infrastructure expands rapidly in the NZE Scenario, evolving from a few small networks to interregional trunklines, along with the conditioning of underground gas storage facilities**

# The rise of the network for the transport and storage of hydrogen

Global hydrogen transmission pipeline length and underground storage capacity in the NZE Scenario, 2020-2050

**Rapid hydrogen supply growth in the NZE Scenario will require and increase in bulk underground storage, equal to more than twice that of natural gas over the last 30 years**

## Hydrogen and CO<sub>2</sub> storage needs in the NZE Scenario

	Hydrogen	CO <sub>2</sub>
<b>By 2050</b>	450 bcm	3 250 bcm
<b>Cumulative to 2050</b>	450 bcm	48 000 bcm

*bcm: at normal conditions*

# Shortening lead times

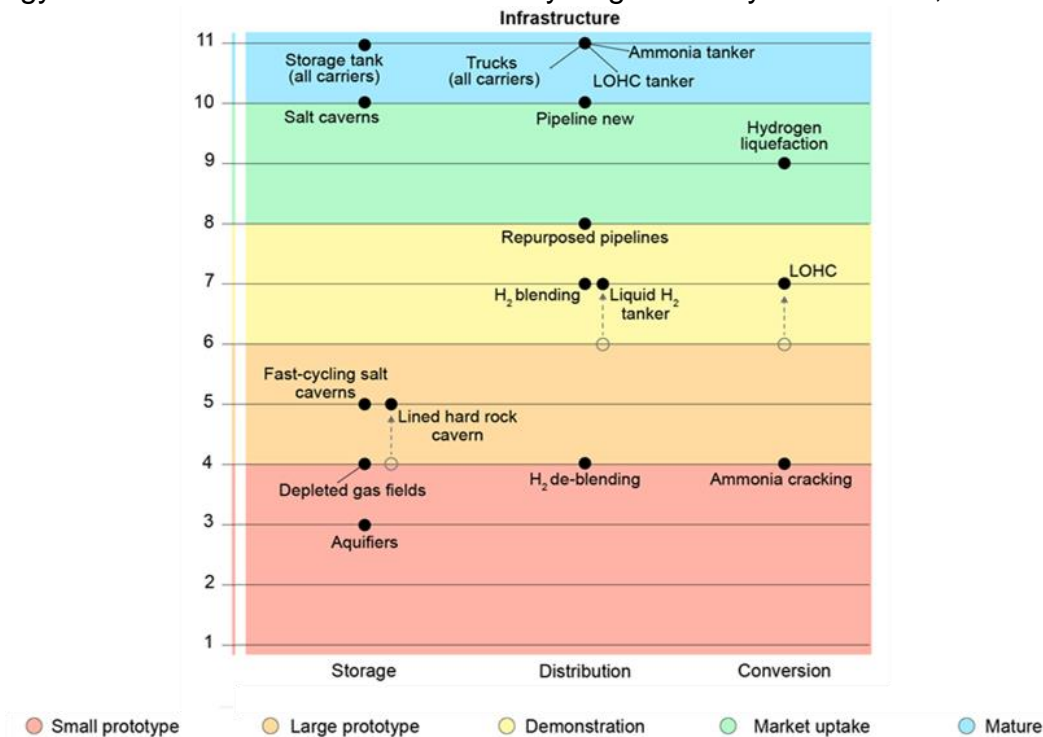

Lead times of selected natural gas infrastructure projects

**Developing new gas infrastructure takes considerable time, so planning must start well in advance and strategies to shorten lead times should be explored**

# Innovation will be key to the success of low-emission hydrogen

Technology readiness levels of low-emission hydrogen and synthetic fuels, and infrastructure

**Several technologies related to hydrogen infrastructure are not yet commercially available on a large scale**

- Announcements on underground gas storage for hydrogen are still limited compared to transmission pipelines.
- A turbo-charged innovation is needed to ensure that knowledge on underground hydrogen storage technologies is demonstrated on a large scale within this decade.
- Adequate planning should be undertaken well in advance, considering an integrated approach to storage needs for natural gas, hydrogen and CO<sub>2</sub>, and taking into account flexibility and energy security concerns.
- Certainty is needed to move from announcements and intentions to actual deployment.
